Responding to Suspicious Login Activity

Login and Account Security

Fictional training documentation for a local RAG demonstration.

Recognize the issue

Examples include sign-in notifications the user does not recognize, unexpected password-reset emails, unfamiliar sessions, or changes the user did not make.

Immediate actions

Use the official CloudDesk security settings to review sessions and sign out unfamiliar sessions if that control is available. Change the password through the trusted sign-in flow and review MFA and recovery settings. For SSO accounts, contact the organization's identity administrator.

Do not share secrets

Never ask the customer to provide their password, MFA code, recovery code, or full payment credentials. Do not copy secrets into ticket notes.

Report details

Record the account email, organization, approximate event time, notification details, and any actions already taken. Ask the customer to redact unrelated personal information from screenshots.

Escalation

Escalate suspected compromise to the Security team promptly using the internal incident process. Do not assure the customer that the account is safe until the security review supports that statement.

Customer communication

Acknowledge the concern, give the immediate safe steps, and explain that the issue is being reviewed. Avoid speculation about who accessed the account or how.
