Roles and Permissions Guide

Account Administration

Fictional training documentation for a local RAG demonstration.

Role principle

Roles determine which areas and actions a user can access. CloudDesk may offer owner, administrator, and member roles, with permissions depending on the organization's configuration.

Owner

The owner is responsible for core organization administration and billing authority. Ownership transfer should follow the approved account-verification process.

Administrator

Administrators can manage permitted organization settings and users. Billing access may depend on the assigned permissions and plan configuration.

Member

Members can use features granted to them but generally cannot change organization-wide billing or security settings unless explicitly permitted.

Access denied

Check the user's organization, assigned role, and the specific action that failed. Ask an authorized administrator to confirm permissions. Do not recommend sharing another user's login.

Escalation details

If the role appears correct but access remains denied, collect the user's role, organization, affected page or action, timestamp, and exact error. Do not include passwords or authentication codes.
