Troubleshooting Missing Email Notifications

Troubleshooting

Fictional training documentation for a local RAG demonstration.

Initial checks

Confirm the email address, check spam and junk folders, inspect notification preferences, and verify whether the message appears in the product's notification center if one exists.

Notification preferences

Users may control some notification types in Settings > Notifications. Organization policies or administrator settings may affect which options are available.

Delivery delays

Email delivery can be delayed by recipient mail systems, filtering, or provider issues. Do not promise a precise delivery time without evidence.

Administrator checks

For organization-wide delivery problems, ask the administrator whether mail filters, allowlists, or domain policies recently changed. Do not ask the customer to weaken security controls globally.

Information for support

Collect the recipient address, message type, approximate send time, organization, and whether other recipients are affected. Never request email account passwords.

Escalation

If several users are affected or logs indicate a delivery failure, route the case to the messaging or engineering team with the collected timestamps and message identifiers, if available.
