# Resolving Dashboard Loading Errors

Troubleshooting

Fictional training documentation for a local RAG demonstration.

## Basic checks

Refresh the page, confirm the network connection, sign out and back in if safe, and try a supported browser with extensions temporarily disabled only when permitted by the user's security policy.

## Scope the issue

Determine whether the problem affects one user, one browser, one organization, or multiple users. Ask for the page, approximate time, and exact error text.

## Browser troubleshooting

If appropriate, test a private window or clear site data for CloudDesk only. Explain that clearing site data may sign the user out. Do not ask the user to share session cookies or authentication tokens.

## Service-wide issue

If multiple users report the same failure, check the official status channel or internal incident process before recommending repeated local troubleshooting.

## Evidence

A screenshot of the error can help, but it should not expose private customer data, tokens, or unrelated browser tabs. Capture a request or correlation ID if the application displays one.

## Escalation

If the issue persists, send the reproduction steps, browser and operating-system versions, time of failure, affected organization, and error details to support engineering.
