Troubleshooting File Upload Failures

Troubleshooting

Fictional training documentation for a local RAG demonstration.

Before retrying

Check the file type and size against the upload limits shown in the CloudDesk interface. This guide does not define a universal size limit; use the current product message or approved documentation.

File name and format

Try a simple file name and a supported format. If the file is damaged or incomplete, create a valid copy and retry. Do not rename a file to a different extension as a substitute for converting its format.

Network and browser

Check the connection and retry once. If appropriate, test another supported browser. Avoid repeated large uploads when the error suggests a server-side problem.

Sensitive documents

Upload only information required for the support case and use approved secure channels. Do not request passwords, payment card security codes, or unnecessary personal documents.

Evidence to collect

Record the file type, approximate size, time, organization, exact error, and whether other files fail. Do not attach confidential files to an internal ticket unless the process authorizes it.

Escalation

Escalate repeated failures with the error text and reproduction steps. If the product displays a request ID, include it.
