Ticket Priorities and Escalation

Support Procedures

Fictional training documentation for a local RAG demonstration.

Priority principles

Priority is based on impact and urgency, not on the customer's tone alone. A widespread outage or security incident generally needs faster attention than a single-user how-to question.

P1 critical

Use P1 for a confirmed or strongly evidenced critical service outage or severe security incident with broad impact. Notify the on-call or incident channel according to the internal process.

P2 high

Use P2 for major functionality unavailable to a group of users or a business-critical workflow with no reasonable workaround.

P3 normal

Use P3 for a limited-impact problem, a single-user issue with a workaround, or a standard product question.

P4 low

Use P4 for cosmetic issues, minor requests, or general feedback that does not block work.

Escalation payload

Include customer impact, affected users, start time, reproduction steps, error text, attempted troubleshooting, and any request ID. Do not claim an incident is confirmed unless evidence supports it.

Priority uncertainty

If impact is unclear, ask concise questions and follow the team's triage policy. Escalate suspected security incidents promptly even while details are being gathered.
